

PRODISPLAY®

360 DUAL IMAGE PROJECTION SCREEN

360° material is a dual projection screen which produces a perfectly viewable image on both sides at the same time, with a 180° viewing angle on both sides. This unique screen performs well even in high ambient light and can be used for either front or rear projection.

There are many advantages of 360 screens; from increased visibility to installation flexibility, users can project an image on either side of the screen, displaying a mirror image on the other side. These screens are a great way to maximise your display space for a fraction of the cost, providing two screens with a single projector.

These screens are generally thin in nature, available in a range of thicknesses they offer a sleek and minimalist way to break up a room whilst displaying HD/4K content. Our 360° technology can also be manufactured as a film with a self adhesive layer meaning it can be easily applied to glass or plexiglas (non adhesive version also available).

SPECIFICATIONS

- Designed for front or rear projection
- Dual image (mirror image on one side)
- Off-white rigid acrylic screen
- High gain - 5.7
- Standard screen sizes from 32"-132"

BENEFITS
